RALEIGH

INTRODUCTION

The State Center for Health Statistics collects and publishes data on a variety of health-related subjects in several different formats. This primer is to serve as a reference for finding the specific data needed in SCHS publications.

Before proceeding with this primer, the matched and unmatched infant death files need to be defined. The matched file is a file in which the births and infant deaths for a specified period have been paired. This file allows for matching birth and death characteristics. Also, the deaths need not have occurred in the birth year, but rather during the first year after the birth. For example, if a child born in December 1988 dies in February of 1989, this death is counted as a postneonatal death in 1989 in the unmatched file. The matched file, however, will show this as a postneonatal death for 1988, because the matched file reflects deaths to children born in the calendar year 1988.

The numbers and rates in the *Birth and Infant Mortality Statistics* volumes are from the matched file. Unless specified, other publications from SCHS use data from the unmatched files.

Two other terms which are often misunderstood are occurrence and residence. Using births as an example, occurrence births are events which happen in an area (state, region, county, city, etc.), regardless of the residence of the mother. Resident births are events that happen to mothers living in an area, regardless of where the birth takes place. For instance, a mother from Hyde County goes into labor in Charlotte and has the baby at Presbyterian Hospital. Since this birth is to a woman who lives in Hyde County, the birth is considered a Hyde County resident birth. The file on occurrences will show this as a Mecklenburg County birth since the event happened at a Mecklenburg County hospital. Unless specifically noted as occurrence births, all birth information issued from the State Center for Health Statistics is resident data. This is because most people are interested in events involving persons who live in an area, rather than those events that happen in an area.

BIRTHS

Birth data are among the most requested items from the State Center for Health Statistics. Births and birth rates are shown in the following publications:

"BABY Book"

Vital Statistics, Volume 1

"Health Statistics Pocket Guide"

Birth and Infant Mortality Statistics, Volumes 1 and 2

Birth rates are expressed as births per 1,000 population, unless they are called fertility rates. Fertility rates are expressed as births per 1,000 females in an age group or per 1,000 total females of childbearing ages (15-44).

DEATHS

Deaths and death rates are shown in the following SCHS publications:

Vital Statistics, Volume 1

Leading Causes of Mortality, Volume 2

"Health Statistics Pocket Guide"

Birth and Infant Mortality Statistics, Volumes 1 and 2

Detailed Mortality Statistics

Death rates are expressed as deaths per 1,000 population for total deaths or deaths per 100,000 population for age-specific or cause-specific death rates.

MARRIAGES AND DIVORCES

There is very limited information available on marriages and even less on divorces. Data are only available on an occurrence basis since the two persons involved may have different counties of residence. Marriages and divorces and rates are shown in *North Carolina Vital Statistics: Volume 1*. Both rates are expressed per 1,000 population.

ABORTIONS

Abortions are reported to SCHS by the abortion providers. These reports show no names and only limited demographic information. Abortions and abortion rates are shown in *North Carolina Reported Abortions* and abortion rates are given in the "Health Statistics Pocket Guide."

Abortion rates are per 1,000 females in specified age groups as well as all women of childbearing ages (15-44).

PREGNANCIES

Pregnancies are a composite of births, abortions and fetal deaths (stillbirths of greater than 20 weeks gestation). These three components are totaled to produce the number of reported pregnancies. Stillbirths of less than 20 weeks gestation are not included in this number, and there is no feasible way to collect these events. Pregnancy rates are shown in the "Health Statistics Pocket Guide" as well as *North Carolina Reported Abortions*.

OTHER HEALTH DATA

The State Center for Health Statistics also collects limited data on hospitals and nursing homes. This information is published in three volumes: *Health Facilities Data Book: Hospital Summary Report*, *Health Facilities Data Book: Patient Origin Report*, and *Health Facilities Data Book: Nursing Home Summary Report*. These books supply data on staffing, bed complement, days of care, and utilization statistics.

The "Health Statistics Pocket Guide" also supplies information on social, demographic and economic indicators; employment, farm and school statistics; social, welfare and medical program expenditures; pregnancy outcome statistics; morbidity and mortality; and health care resources data. These data come from a variety of sources for the United States, North Carolina, and the South Atlantic Area with a ranking of where N.C. falls among other states in the nation.

The *Local Health Department Survey Summary* compares staffing and facility data for the Department of Human Resources regions. Included are the number of staff by occupational categories, contract staff hours worked, number of satellite sites and various questions about the buildings health departments are housed in. These data are most useful for comparing a county to state and regional data to determine unfavorable (or favorable) staffing or building situations.

N.C. Communicable Disease Morbidity Statistics is produced by the Communicable Disease Branch of Health Services and is distributed by SCHS. The Communicable Disease Report Card is used to report certain communicable diseases within the state of North Carolina. This data is available for N.C., each county, and military bases in the state.

REGIONAL DATA

Most SCHS publications contain data for Department of Human Resources Regions (DHRs), Perinatal Care Regions (PCRs) and Health Service Areas (HSAs). These regions are used for planning purposes and provide more stable rates than county-level data. Some reports also include data for cities with greater than 10,000 population in the most recent U.S. census.

ALPAHBETICAL LISTING OF DATA BY SOURCE

Because SCHS publishes similar information in many reports, it is helpful to know where to find the specific type of information needed. The following pages provide an alphabetized listing of data types and the source(s).

KEY WORDS	PUBLICATION	GEOGRAPHIC AREA COVERED	VAR. 1	VARIABLE 2	VARIABLE 3	VARIABLE 4	EXPRESSED AS	EXPRESSED AS
